Abstract

Lowland savannas, covering an area of 2,342 km², form the third largest ecosystem in Belize yet are unevenly and therefore poorly represented in the country's protected area system. Based on more than 5,700 herbarium collections, a checklist of 957 species of vascular plants is presented for this ecosystem representing ca. 28% of the Belizean flora, of which 54 species are new records for the country. Of the 41 species of plants known to be endemic to Belize, 18 have been recorded within the lowland savanna, and nine species are listed in The World Conservation Union (IUCN) 2010 Red List of Threatened Species. Of the total savanna ecosystem flora, 339 species are characteristic of the open savanna, whilst 309 and 114 species are more frequent in forest and wetland areas respectively. Most species (505, 53% of the lowland savanna flora) are herbaceous. Although the lowland savanna has been relatively well collected, there are geographical biases in botanical sampling which have focused historically on the savannas in the centre and the north of the country. A brief review of the collecting history of the lowland savanna is provided, and recommendations are given on how future collecting efforts may best be focused. The lowland savanna is shown to be a significant regional centre of plant diversity.

Key words: wetland, flora, conservation, endemics

Introduction

Savannas cover over two million km² of the Neotropics (Mistry 2000), making savanna the most ecologically dominant formation of tropical America after tropical forest. However, they suffer from great anthropogenic pressure, particularly from agricultural development (Alho & de Souza Martins 1995). Within Central America and the Caribbean, extensive areas of savanna occur in Belize, Mexico, Honduras, Nicaragua, south-west Panama and central and eastern Cuba (Huber 1987).

Savannas are extensive areas of tropical vegetation usually with a ground layer of grasses and xeric herbs and a varying cover of trees. They cover great areas in the tropics that have a strong dry season and are generally subject to seasonal fires to which their native flora has resistant adaptations (e.g. thick corky bark, subterranean lignotubers). One form, the "savanna woodlands" of South America and Africa support characteristic tree floras. Their rainfall is typically between that of wet forest and desert or semi-desert biomes.

Belize is 22,965 km² in land area. It is located in the southern part of the Yucatán Peninsula and bordered to the north by the Mexican state of Quintana Roo, to the south and west the Guatemalan department of Petén and to the east, by the Caribbean Sea. Belize's climate is subtropical, 23°C (monthly mean in December) to 31°C (monthly mean in June), experiencing a marked dry season between February and May, and a hurricane season between June and November. There is a significant precipitation gradient between the north (ca. 1,200 mm/year) and the south (ca. 4,300 mm/year) with maximum rainfall occurring around Doyle's Delight in Toledo District. Belize is part of the Mesoamerican biodiversity hotspot (Conservation International 2004) which occupies less than 0.5% of the terrestrial planet which is thought to contain 17% of all terrestrial species.

Savannas comprise 2,824 km² or 12.3% of the land area of Belize and are found across the length of the country at altitudes from sea level to more than 1,000 m (Mountain Pine Ridge). They are the second largest

natural biome after lowland broadleaved forests (Meerman & Sabido 2001a). Despite its extent the savanna ecosystem is poorly represented in Belize's extensive protected areas system (Meerman 2005). The lowland savannas (<500 m in altitude) studied here occupy 2,342 km² or 10.2% of the land area of Belize (Meerman & Sabido 2001a). Whilst approximately 26% of the lowland savanna are within protected areas, Cameron *et al.* (2010) have estimated from archive satellite imagery that around 200 km² or some 12% of former lowland savanna areas have been converted to other land uses since 1980, comparable to the rates of deforestation in Belize (Cherrington *et al.* 2010).

The influence of geology and soils on savanna distribution in Belize is not fully understood but the substrates on which savanna occur are acid and infertile. In the north of the country, however, savanna appears to be confined to coarse-textured palaeo-alluvial deposits eroded from the Maya Mountain Massif and from ancient littoral deposits (Romney 1960), interspersed with calcareous outcrops (where forest is predominant). Savanna to the south of the Belize River Valley occurs over sands and gravels derived from the many streams issuing from the Maya Mountains.

We define lowland savanna as any natural or semi-natural, fire-influenced ecosystem under 500 m in altitude with a continuous herbaceous layer dominated by native grasses and sedges. Trees and shrubs may occur to a lesser or greater extent. Where present, *Pinus caribaea* Morelet (1851: 107) (pine), *Acoelorrhaphe wrightii* (Wendland in Grisebach, 1866: 220) Wendland in Beccari (1907: 109) ex Beccari (1907: 113) (palmetto), *Byrsonima crassifolia* (Linnaeus 1753: 426) Kunth (1821: 149) (craboo), *Curatella americana* Linnaeus (1759: 1079) (yaha or sandpaper tree), Melastomataceae spp. and *Quercus oleoides* Schlechtendal & Chamisso (1830: 79) (live oak) are usually amongst the most structurally conspicuous non-herbaceous elements. Lowland savannas that experience annual sequences of flooding and drought related to the wet and dry seasons (i.e. hyperseasonal *sensu* Sarmiento, 1983) are included. Excluded from our definition are the upland pine savannas of the Maya Mountains, notably the Mountain Pine Ridge which are composed primarily of *Tropical evergreen seasonal needle-leaf lowland hill forest*, *Tropical evergreen seasonal mixed needle and broadleaf submontane forest* and *Tropical evergreen seasonal needle-leaf submontane forest* (Meerman & Sabido 2001b) and are predominantly above 500 m in altitude. The Mountain Pine Ridge is a floristically unique and highly managed, submontane savanna which is recognised as separate by the current UNESCO Central American Ecosystems Map (Meerman & Sabido 2001b). Also excluded are two vegetation types that superficially resemble lowland savanna: tiger bush (*Dicranopteris* spp.) thickets (*Fire-induced lowland fern thicket* and *Fire-induced submontane fern thicket* (Meerman & Sabido 2001b)) and saline-influenced coastal savannas (*Marine salt marsh with many succulent species* (Meerman & Sabido 2001b)).

Small patches or islands of broadleaf forest located within lowland savanna are excluded from this checklist as there is huge variation in the floristic composition of these forest 'islands' across Belize. Their inclusion would result in a checklist of a significant proportion of the entire broadleaf forest flora of Belize.

Previous classifications of ecosystems in Belize have been discussed by Bridgewater *et al.* (2002). The vegetation system currently adopted in Belize is the UNESCO Central American Ecosystems Map (Meerman & Sabido 2001b). This system draws heavily upon previous work by Wright (1959) and Iremonger & Brokaw (1995). The above definition of lowland savanna encompasses UNESCO vegetation classes, *Tropical evergreen seasonal needle-leaf lowland dense forest*, *Short-grass savanna with needle-leaved trees* and *Short grass savanna with shrubs*.

Different authors have treated the vegetation which we refer to as lowland savanna within their own classification systems that are adapted to a finer scale or specific sites within this ecosystem (Bridgewater *et al.* 2002, Laughlin 2002). For example Beard (1953) described the savannas of Central America as homogenous with four identifiable 'phases'; *Open savanna*, *Orchard savanna*, *Palm savanna* and *Pine savanna*, and two fringe types *Sedge savanna* and *High grass savanna*. Bartlett (1935) recognised two variants within Beard's *orchard*: *Nanzal*, dominated by *Byrsonima crassifolia*; and *Encinal*, consisting of isolated well-defined islands of oak woodland with sparse ground cover and frequent patches of exposed white sand. Bridgewater *et al.* (2002) discussed the structure of the savannas and wetlands observed in the Rio

Bravo Conservation and Management Area. They identified six distinct vegetation types within the savanna landscape and five vegetation types within the associated wetland ecosystem. Savanna classes included *Grassland & scrub grassland*, *Pine palmetto savanna*, *Palmetto thicket*, *Savanna orchard*, *Woodland and pine ridge* and *Oak thicket*. The wetland was observed to consist of *Fringing riverine red mangrove*, *Cutting grass marsh*, *Marl flat*, *Sedge marshland* and *Eleocharis calabash marsh*. Laughlin (2002) recognised three types of savanna formation at Monkey Bay Wildlife Sanctuary; *Dry savanna*, *Mesic savanna* and *Oak hammocks*. Hicks *et al.* (2011) found three types of formation at upland San Pastor savanna; *Pine-dominated savanna*, *Fringing oak woodland* and *Savanna swamp*.

Early work on the floristic composition of the Belizean savannas, such as Johnson *et al.* (1973) and Johnson & Chaffey (1974) traditionally focused on pine timber and its extraction. For many years only brief discussions of the vegetation and characteristic species were available for the savannas of Mountain Pine Ridge (Hunt 1970; Johnson *et al.* 1973) and the southern coastal plain (Hunt 1970, Johnson & Chaffey 1974). Detailed species lists were provided by Furley & Ratter (1989) with their brief surveys of Spanish Lookout, Belize Zoo, Gracey Rock and Mountain Pine Ridge, resulting in a list of 58 species across the four sites. More recently detailed floristic surveys of savanna vegetation type in Belize have been published for Monkey Bay Wildlife Sanctuary (Laughlin 2002), coastal savanna at Sapodilla Lagoon (Farruggia *et al.* 2008), the disjunct savanna woodland at San Pastor in the Chiquibul (Hicks *et al.* 2011) and the savanna and wetlands of the Rio Bravo Conservation and Management Area (Bridgewater *et al.* 2002).

The influence of fire on savanna ecosystems is the best studied aspect of savanna ecology in Belize (Kellman 1984, Kellman *et al.* 1985, Miyanishi & Kellman 1986). It is well acknowledged that studies on ecological determinants of savannas additional to fire are needed (Furley 2004). However, the prerequisite for such studies is baseline data and a comprehensive list of vascular plant species. Belize has a preliminary checklist of vascular plant species (Balick *et al.* 2000) which provides great detail on the habit, local uses and vernacular names of 3,408 species but does not indicate which vegetation type a species is associated with. Local checklists such those by Bridgewater *et al.* (2002, 2006) and Hicks *et al.* (2011) give some indication of vegetation type and species distribution. These latter papers have highlighted the need for a nationwide checklist for the lowland savanna flora which would underpin the creation of identification keys, photographic guides and potentially highlight plant species of special worth and areas for conservation.

The aim of this paper is to provide the first comprehensive checklist of savanna species, their distributions within the country and ecosystem affinities.

Methods

A checklist of lowland savanna species and their distributions was assembled from a total of 5,147 specimen records collated using a combination of two main data sources. Firstly, collection records for Belize were collated from the herbaria of BM, BRH and E. Secondly, a series of additional vegetation surveys was conducted in lowland savannas across Belize producing a total of 645 specimen collections in an effort to achieve a more representative sample.

Collection records were collated during 2010 and 2011. Additional specimen information for rare species was acquired from the online resources of five institutions F, GH, K, MICH, NY and US. After assembling the specimen data for Belize each record was examined and classified as being from savanna or not on the basis of vegetation description and location.

The field surveys were made at 78 sites from September 2009 to December 2010 to expand upon the geographical coverage of existing records from collection records. Sites were chosen to include representative examples of the distinct savanna formations mapped by Cameron *et al.* (2010) using recent satellite imagery. Effort was made to acquire a relatively even spread of sites across the country (Figure 1, Table 1) and particularly to cover areas where there had been few or no previous collections. At each site known species, recognised with certainty by the first author (ZAG) or those well represented in herbaria were cited as

FIGURE 1. Map of collection localities in the Belizean lowland savanna surveyed for this study (orange, 1–23) and prior to the start of this study (red, 24–57) with more than 25 specimen records. Collection localities labelled in Table 1.

observed. Unknown and all poorly known or rare species were collected, and duplicates deposited at E, BRH and if extra duplicates were available, also at BM, MEXU, MO and K. Specimens were identified using available taxonomic revisions, monographs and Floras and by comparison with herbarium collections at BM, BRH and E. To allow independent verification of species identifications only names supported by herbarium specimens have been included in this checklist.

This checklist is designed for use by anybody interested in the lowland savannas of Belize but will be especially useful to professionals and students who have some botanical knowledge. The checklist was checked and synonymy updated using the International Plant Names Index, Tropicos, The Plant List and available monographs and Floras. Where sources conflicted priority was given to recent monograph or Flora accounts. The data-mining of electronic herbarium catalogues generated too many specimen records for us to check and confirm comprehensively (principally those at E and MO). Although not all determinations were confirmed, any records whose identity seemed improbable were checked carefully before their inclusion in the checklist. The majority of records were of species for which the taxonomy is well known. Only binomials at rank of species are included as identification of specimens to subspecific ranks appears to have been inconsistent. However subspecific taxa that have been recorded in the lowland savanna are included in notes under the species entry. Names from recent published surveys (Laughlin 2002, Farruggia *et al.* 2008) were examined and considered for inclusion, however, as they do not cite voucher specimen information these names are excluded from the main checklist. Species habit was determined from specimen label information from specimens collected in Belize following Bridgewater *et al.* (2002, 2006). Most are standard terms commonly used in botany and defined following Hickey & King (2000). ‘Shrublet’ is used following Bridgewater *et al.* (2000) for species which initially appear herbaceous but which upon closer inspection have a woody or underground stem, or lignotuber. The vegetation type presented for each species is that of the majority of specimens collected in Belize. All species in this checklist by definition have been recorded from lowland savanna but some species are much more often found in other habitats. For example, *Renanthera aromatica* (Aublet 1775: 3) Grisebach (1857: 275) is included in the checklist because this species was collected in lowland savanna near Hill Bank in 2010, however this species is primarily found in broadleaf forest.

TABLE 4. Additional names to be considered for the lowland savanna flora, extracted from literature (Farruggia *et al.* 2008, Laughlin 2002) but not included in this checklist due to the absence of cited specimens.

Family	Species, reference and notes
Lindsaeaceae	<i>Lindsaea lancea</i> (L.) Bedd. Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Forest herb collected elsewhere in Belize.
Asteraceae	<i>Emilia sonchifolia</i> (L.) DC. ex DC. Ref: Monkey Bay; (Laughlin 2002) Note: Herb of disturbed areas collected in other vegetation types in Belize, but easily mistaken for <i>Emilia fosbergii</i> Nicolson which is frequently collected in the savanna.
Asteraceae	<i>Koanophyllon albicaule</i> (Sch. Bip. ex Klatt) R.M. King & H. Rob. Ref: Monkey Bay; (Laughlin 2002) Note: Common shrub/tree in forest edges throughout Belize.
Convolvulaceae	<i>Cuscuta indecora</i> Choisy Ref: Monkey Bay; (Laughlin 2002) Note: Parasitic twiner recorded previously in Belize (Balick <i>et al.</i> 2000) however this record is likely to be a misidentification of <i>Cassytha filiformis</i> L.
Cyperaceae	<i>Rhynchospora elliottii</i> A. Dietr. Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Herb of pine woodlands, however only recorded in the United States (TROPICOS 2010).
Euphorbiaceae	<i>Acalypha arvensis</i> Poepp. Ref: Monkey Bay; (Laughlin 2002) Note: Shrublet (or shrub) of disturbed areas common throughout Belize.
Lamiaceae	<i>Hyptis atrorubens</i> Poit. Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Herb of disturbed ground collected in other vegetation types in Belize.
Lamiaceae	<i>Hyptis brevipes</i> Poit. Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Forest herb collected rarely in other vegetation types in Belize.
Loranthaceae	<i>Oryctanthus spicatus</i> (Jacq.) Eichler Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Epiphyte not collected in other vegetation types in Belize.
Malvaceae	<i>Sida acuta</i> Burm. f. Ref: Monkey Bay; (Laughlin 2002) Note: Common herb in disturbed areas around Belize.
Myrsinaceae	<i>Myrsine cubana</i> A. DC. Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Shrub of the high elevations collected occasionally in Belize.
Orchidaceae	<i>Catasetum integerrimum</i> Hook. Ref: Monkey Bay; (Laughlin 2002) Note: Epiphytic orchid collected in other vegetation types in Belize.
Orchidaceae	<i>Cyrtopodium punctatum</i> (L.) Lindl. Ref: Monkey Bay; (Laughlin 2002) Note: Epiphytic orchid collected in other vegetation types in Belize.
Poaceae	<i>Andropogon gerardii</i> Vitman Ref: Sapodilla Lagoon; (Farruggia <i>et al.</i> 2008) Note: Herb collected in the Mountain Pine Ridge

The 957 species listed here represent 131 families and 467 genera, of which 930 (97%) are angiosperms. This represents approximately 28% of Belize's flora as recognised by Balick *et al.* (2000). Fifty-four entries represent new species records for Belize (Table 2). These include one new family, Krameriaceae, and six new genera: *Alysicarpus* (Fabaceae), *Baltimora* (Asteraceae), *Funastrum* (Apocynaceae), *Krameria* (Krameriaceae), *Ronabea* (Rubiaceae) and *Trichostigma* (Phytolaccaceae). Twenty-seven species mentioned but not accepted by Balick *et al.* (2000) are maintained here (Table 3).

Eighteen of the 41 species endemic to Belize (Balick *et al*, 2000) are here reported from lowland savanna (Table 5) and six of these species are known only from lowland savanna (Table 5). Twelve species endemic to Belize are found in both lowland savanna and the submontane savanna of the Mountain Pine Ridge. Three species endemic to Belize are found in both savanna and broadleaf forest: *Calyptanthus cuneifolia* (Lundell 1943), *Crossopetalum gentlei* (Lundell 1961) and *Schippia concolor* (Burret 1933). In addition, nine species in the checklist are included in the current IUCN Red List of Threatened Species (IUCN 2010) (Table 6).

The most species-rich families for lowland savanna are Fabaceae (108 species), Cyperaceae (sedges, 100 species) and Poaceae (grasses, 96 species) (Table 7). The most species-rich genus is *Rhynchospora* (38 species, Cyperaceae), *Scleria* (15 species, Cyperaceae), *Utricularia* (15 species, Lentibulariaceae), *Paspalum* (14 species, Poaceae), *Miconia* (13 species, Melastomataceae), *Eleocharis* (12 species, Cyperaceae), *Panicum* (12 species, Poaceae), *Eragrostis* (10 species, Poaceae) and *Eugenia* (10 species, Myrtaceae).

TABLE 9. Summary of lowland savanna species by vegetation type. All the species have been recorded in the lowland savanna at least once. These vegetation type categories are where most of the specimens have been recorded for each species. Although these vegetation types have not been surveyed for this checklist, some of the species in the lowland savanna are more commonly recorded from, for example, forest in Belize. Since they have been collected in savanna they are recorded in the checklist, but listed under “forest” in this table.

Forty-six percent (442) of the species included in the Checklist are herbs, 37% (362) woody species (trees, shrubs, shrublets and palms) and 5% (47) are parasitic or hemi-parasitic climbers and epiphytes (Table 8). Thirty-five percent (339) of the species in the checklist (35%) have the majority of their records from the lowland savanna and 12% (114) in wetland areas. Thirty-two percent (309) of the species occur in lowland savanna but have the majority of their records in forest vegetation types (Table 9). Two thirds of these latter species are herbs (62%) and 26% are lignified (trees, shrubs, shrublets and palms). This would suggest that trees and shrubs are less tolerant of the edaphic and fire conditions characteristic of the savanna than herbaceous species.

The database of previous collections assembled for this checklist contains 4,332 specimens made by over 170 collectors. This database (Goodwin *et al.* 2011) provides a consolidated view of the history of botanical collecting in Belize — a subject that has been reported on previously by Spellman *et al.* (1975), Balick *et al.* (2000) and Brokaw (2001).

Most of the collections from the Belizean lowland savanna are (in alphabetical order) at the Missouri Botanical Garden (MO), Natural History Museum (London; BM), New York Botanic Garden (NY), and the Royal Botanic Garden Edinburgh (E). Whilst there has traditionally been a lack of local collecting expertise within Belize, Gentle, who remains one of the most important collectors in the country in general and of the savanna flora in particular (with c. 700 collections) was a notable exception (Table 10). In addition, with the advent of the Flora Mesoamericana project there has been considerable interest in Belizean savannas by researchers from Missouri John Dwyer & Ronald Liesner (1967–1980), Thomas Croat (1973) and Gerrit Davidse with Alan Brant & Douglas Holland (1987, 1996–1997) (Table 10). The long running interest in Belize from the Natural History Museum (London) and more recently the Royal Botanic Garden Edinburgh has also led to significant collections (Table 10) by Caroline Whitefoord (BM; 1976–2005), Alicia Ibáñez García & Samuel Bridgewater (E; 1996), and MSc students from the Royal Botanic Garden Edinburgh (E; 2000–present).

Botanical collecting in the lowland savannas has traditionally focused on the northern and central parts of the country (Table 11) with Belize District (>2,000) being the most heavily collected. Orange Walk (>800), Stann Creek (> 600) and Toledo (>500) Districts appear to be under-represented in relation to the area of savanna found in these Districts. In contrast, the low numbers of collections from Cayo and Corozal (<100 each) probably reflect the general scarcity of lowland savanna in these two districts.

Prior to this study five lowland savanna locations had more than 200 collections (Figure 1, Table 1): the vicinity of Mile 29–31 on the Western Highway including Belize Zoo, Churchyard, Colonel English Creek, Colonel English Pine Ridge, Monkey Bay, Parrots Wood, the Place and the Tropical Education Center (752), Rio Bravo Conservation and Management Area (RBCMA) between Hill Bank Field Station and East Gate (608)), Ridge Lagoon Plantation including Mile 12 of the Northern Highway and Sand Hill (259), All Pines (228) and Hattieville (291).

Discussion

Previous published floristic checklists for four savanna areas in Belize: the Monkey Bay Wildlife Sanctuary (MBWS) (Laughlin 2002), the Rio Bravo Conservation and Management Area (RBCMA) (Bridgewater *et al.* 2002), Sapodilla Lagoon (Farruggia *et al.* 2008) and the submontane savanna at San Pastor (Hicks *et al.* 2011) enumerate a total of 434 vascular plant species (MBWS, 198; RBCMA, 258; San Pastor, 126; Sapodilla Lagoon, 201). Lowland savanna comprises 10.2% of the land cover of Belize (Meerman & Sabido 2001a, Cameron *et al.* 2010) and 28% of its vascular plant species. Our results significantly build on this figure, expanding the total number of lowland savanna recorded vascular plant species to 957, updating their taxonomy and providing important distribution and habitat information for each species.

This checklist was designed to highlight the floristic importance of the lowland savanna and the number of species that are restricted to it with the aim of providing a baseline knowledge for conservation.

This checklist does not fully represent the true level of species diversity within a savanna landscape which also includes forest patches and gallery forests. Pither & Kellman (2002) propose that a checklist for the whole savanna landscape which included gallery forests and forest patches would yield a greatly increased number of species being recorded. The floristic composition of these forest intrusions needs to be investigated further because very few specimens have been collected in them.

In addition to representing an important component of the Belizean flora, lowland savanna hosts 44% (18) of Belize's endemic species, in contrast to its proportion of the Belizean flora (28%). This supports Balick *et al.* (2000) prediction of their relative importance for endemic species. All of the endemic species recorded from lowland savanna occur exclusively or almost exclusively in the savanna ecosystem. The lowland savanna flora probably also contains many species that are endemic at the regional scale, such as *Pachyanthus lundellianus* (Williams 1963: 573) Judd & Skean (1991: 62). In addition to the importance of this vegetation type in the context of Mesoamerica which needs to be explored further it makes a significant contribution to the biodiversity of Belize.

At the family level the composition of the lowland savanna flora is similar to that of the Belizean flora as a whole, Fabaceae, Poaceae, Rubiaceae, Asteraceae and Melastomataceae being amongst the most species-rich families in both. Two exceptions are the Orchidaceae, the second most species-rich family in Belize (Balick *et al.* 2000) and eleventh in the lowland savanna and the Cyperaceae, fifth most species-rich family for Belize (Balick *et al.* 2000) and the second most species-rich family in lowland savanna. The lack of topographical variation and host trees in lowland savanna for the mainly epiphytic orchids and the abundance of open damp areas suitable for sedges may explain these observations respectively. Lowland savanna also includes some groups that are almost exclusive to lowland savanna. For example, lowland savanna is a centre of species-richness for Belize of the species-rich genera, *Rhynchospora*, *Scleria*, *Utricularia*, *Eleocharis*, *Eragrostis*, *Chamaecrista*, *Fimbristylis* and *Polygala*. The Eriocaulaceae are entirely confined to savanna and wetland vegetation. Eriocaulaceae contains six Belizean endemics in lowland and the upland savanna. Forest taxa such as *Piper* (28 species in Belize, Balick *et al.*, 2000, two in this checklist) are often species-poor or entirely absent from the lowland savanna.

It is interesting to compare the Belizean lowland savannas with the cerrado biome that is the natural vegetation of c. 2 million km² of Central Brazil. In many areas the physiognomy of the vegetation of the two is rather similar: a relatively sparse cover of small, somewhat xeromorphic trees c. 4-5 m tall. However, the water-table in this type of vegetation in Belize is normally much higher than in Brazil, where during the dry season it is very deep. Two of the dominant tree species in Belize, *Byrsonima crassifolia* and *Curatella americana* are also common in the cerrado but always associated with a high water table. They are also abundant and widespread under similar hydrologic conditions in the llanos of Venezuela and other parts of South America. Other species found in the Belizean lowland savanna, such as the oaks and pines do not occur naturally in the cerrado while the arboreal element is usually much richer with up to 40-80 native tree species growing together.

The flora described in this checklist is dominated by herbaceous species (53%) with fewer woody species such as trees, shrubs and palms (31%), confirming previous work (Laughlin 2002, Farruggia *et al.* 2008). Many of the most species-rich genera in the lowland savanna are herbaceous.

The importance of herbaceous species to the biodiversity of lowland savannas demonstrates the need for repeated surveys throughout the year to observe ephemeral and seasonal species. For example, the Eriocaulaceae which are notoriously difficult to identify and high in endemics, however only one of the three lowland savanna surveys conducted previously (Farruggia *et al.* 2008) reported a single *Eriocaulon* and this was not identified to species. Our field experience and work with herbarium specimens both suggest that September to February is the best time of year to find Eriocaulaceae. Previous surveys did not sample this time of year, in general however collections are good for the rest of the year. There is a need for research into the status and distribution of many of the endemic species and also for comprehensive checklists to be assembled for areas of lowland savanna within particular protected areas.

This paper provides an APG3 compatible checklist for the lowland savanna of Belize. It is intended that this will underpin future research into the diversity and conservation of this ecosystem. Checklists of this nature based on up-to-date nomenclature and citing specimens are vital to conservation efforts in Belize and the Mesoamerican region, the second most important of 25 hotspots in the world for species diversity and endemism (Conservation International 2004). The lowland savanna ecosystem is under-represented within the current Protected Area System of Belize (Meerman 2005) and is perceived to be under threat from land development for housing, new roads and especially for conversion to pasture, aquaculture and even agriculture. This is despite the presence within the savannas of economically important species such as *Pinus caribaea*, *Acoelorrhaphe wrightii* (Chi-Cawich 2010) and as a habitat for the endangered Yellow-headed Parrot, *Amazona oratrix* Ridgway (1887: 587). This checklist indicates that the lowland savannas of Belize are an important component of the vascular plant biodiversity of Belize and Mesoamerica.

Format of Checklist

957 species are given in the checklist of the vascular plants of the lowland savanna of Belize, together with relevant synonymy, literature references, notes on nomenclature including subspecific taxa, local names compiled from Balick *et al.* (2000) and herbarium label data, habit, vegetation type, and voucher information organised by locality within the six districts of Belize, including type information and endemic status where appropriate. Species are organised alphabetically by family within each major group. Angiosperm families follow Angiosperm Phylogeny III (2009), ferns and allies follow Smith *et al.* (2006). Specimens collected by Rose-Innes, Bridgewater and Ibáñez García often have prefixes of RRI, S and AI respectively; these have been removed from the specimens cited in this checklist as they are not a separate number series.

Xyris paraensis Poepp. ex Kunth **Ref:** Davidse *et al.* (1994: 175). **Habit:** Herb. **Vegetation Type:** Savanna/Wetland. **Vouchers:** BELIZE: Hattieville Dwyer, J.D. 10081 (MO). STANN CREEK: All Pines Schipp, W.A. S131 (BM, MO).

Xyris smalliana Nash **Ref:** Davidse *et al.* (1994: 177). **Habit:** Herb. **Vegetation Type:** Savanna/Wetland. **Vouchers:** BELIZE: International Airport Bartlett, H.H. 11252 (MO). STANN CREEK: Sapodilla Lagoon Woo, J. 708 (MO). ZINGIBERACEAE

Renealmia aromatica (Aubl.) Griseb. **Ref:** Standley & Steyermark (1952: 199). **Local Name:** Kix-im-tzi, Rat Plantain, Wild Ginger. **Habit:** Shrublet. **Vegetation Type:** Forest. **Voucher:** ORANGE WALK: Hill Bank, 2km South Trevaskis, A. 3 (BRH, E).

Acknowledgements

This checklist has been produced as part of Darwin Initiative Project 17-022: “Conservation of the Lowland Savannas of Belize” (<http://eeo.ed.ac.uk/sea-belize>), funded by the UK Government Department of Environment, Food and Rural Affairs.

We thank the Belize Forest Department for permission to work in Belize, the past and present staff of BFREE, PfB, TIDE and Wildtracks for supporting our botanical fieldwork, the staff at BRH and BM for allowing us to visit and access their collections and all the field botanists whose herbarium collections form the basis of this work. Alex Monro and William Milliken are thanked for their contribution after a critical reading of the manuscript as reviewers. In addition, thanks are due to Larry Kelly for advice on taxonomy, Anton Reznicek for finding specimens and to Denis Filer and the BRAHMS development team for help and advice with data. The dataset described in this paper is accessible online at <http://dps.plants.ox.ac.uk/bol/seabelize>.
