Positioning Mentoring as a Coach Development Tool: Recommendations for Future Practice and Research
Mentoring as a Coach Development Tool

Abstract

Current thinking in coach education advocates mentoring as a coach development tool to connect theory and practice; however, little empirical evidence exists to evaluate the effectiveness of mentoring as a coach development tool. Business, education and nursing precede the coaching industry in their mentoring practice and research findings offered in these domains could be drawn upon to position mentoring as sports coaching development tool. Given the remote basis of some of the mentor-coach relationships that exist in sports coaching additional learning can be drawn from mentoring conducted by virtual or electronic mediums. This paper concludes with a series of reflective questions arising from research findings in other domains, designed to engage the potential coaching organization with the mentoring process.

Keywords Mentoring, coach development, informal & formal learning, effectiveness, mentor-coach relationships
Research exploring coach learning and development remains a relatively unexplored area with the most effective mechanisms for educating and supporting coaches still being contested (Nash & McQuade, 2014). According to the International Council for Coaching Excellence (ICCE, 2012, p. 10) coaching is defined as ‘a process of guided improvement and development in a single sport at identifiable stages of athlete development.’ It is the many different contexts and environments in which coaches can, and do, operate that poses problems for large scale, formal coach education programmes that currently are advocated in many countries (Mallet, 2010).

Formal learning, which has traditionally dominated coach education, is located almost exclusively within the classroom setting and offered by educational establishments such as Higher Education Institutions (HEIs) and National Governing Bodies (NGBs) (Jones, 2006). Whilst formal learning can provide coaches with access to essential need-to-know information leading to the achievement of awards, certificates and qualifications, these programs of study are not as valued by coaches as their day-to-day experiences in the field because of the lack of experiential opportunities to apply and reflect on learning (Werthner & Trudel, 2006). Significant personal learning can occur spontaneously within the context of real work; on the field, track, court, or poolside because the learning is situated within the context in which it is applied, that is the coaching environment (Marsick & Volpe, 1999; Lave & Wenger, 1991).

This learning is referred to as informal learning and, in the context of the coaching environment, coaches learn through on-going interactions, observations, listening and from reflections on their own coaching practice (Nash & Sproule, 2011). Informal learning
Mentoring as a Coach Development Tool

challenges coaches to adopt a problem solving approach to explore real life situations and find solutions (Lave & Wenger, 1991). Conceivably this method of connecting theory to practice and practice to theory is applicable to any coach who is open and receptive to learning from practical experience, has sufficiently evolved independent learning skills and the motivation to undertake this or who is appropriately supported in the field, however many coaches struggle to make sense of the complexities of coaching on their own (Werthner & Trudel, 2006; Kerka, 1998). Mentoring could be considered as an effective and accessible method of supporting practice in the field.

Current research in coach education advocates mentoring as a coach development tool to connect theory and practice and coach education providers are being challenged to relocate learning from the classroom into the practical environment to offer opportunities for professional development (Mallet et al., 2009; Cassidy, Jones & Potrac, 2009; Rynne, Mallet & Tinning, 2006; Billet, 2001). Mentoring can act as the bridge between theoretical learning drawn from the formal education environment and the practical application of that learning in the field and many coach-mentoring programs have been put in place by organizations to support coaches in the field (e.g. National Governing Bodies, and lead agencies such as UK Sport and Coaching Association of Canada). The intent behind these mentoring programs is to enable coaches to benefit from the many opportunities experiential learning provides, although the effectiveness of these programs is yet to be explored. In fact little empirical evidence exists to authenticate the effectiveness of mentoring as a coach development tool and opportunities to undertake research and explore how mentoring programs and independent coach-mentor relationships can contribute to coach learning should be prioritized (Cassidy, Jones & Potrac, 2009; Cushion, 2006; Bloom et al, 1998).
The aim of this paper is to position mentoring as a coach development tool. As suggested by the ICCE in their global strategy (2010) there are a number of challenges facing coaching, coaches and coach educators, not least encouraging and supporting the ongoing learning and professional development of coaches and coaching systems. This article will draw on limited mentoring research within the sports coaching and coach development literature as well as business, education and nursing to provide a parallel and more detailed perspective. In addition the concept and practice of electronic mentoring will be explored as a discrete domain as this is an area, which is growing in credibility both in terms of the breadth of practice and the growing research base (Hamilton & Scandura, 2003).

Origins and Definitions of Mentoring

Mentoring originated in Greek mythology, where Mentor, friend and advisor to Odysseus (King of Ithaca) was entrusted with the upbringing of Odysseus’s son (Telemachus) while Odysseus was fighting the Trojan War. Mentor became Telemachus’ teacher, coach, counselor and protector, building a relationship based on affection and trust (Gutierrez, 2012). Since this first documented mentoring relationship, mentoring has existed in formal and informal guises and, as a result, numerous mentoring definitions exist; the best parallel to draw for this study is offered by Weaver and Chelladurai (1999) who developed a mentoring model for management in sport and physical education (PE). Consistent with Mentor’s role they define mentoring as ‘a process in which a more experienced person serves as a role model, provides guidance and support to a developing novice, and sponsors that novice in his/ her career progress’ (Weaver & Chelladurai, 1999; p. 25).

Mentoring in Sports Coaching and Coach Development
Mentoring in sports coaching has been provided both informally and through structured formal programs. Informally mentoring is evidenced through interactions (e.g., observation and conversation) in the practical coaching context (Jones, Harris & Miles, 2009; Armour Gilbert & Trudel, 2001). The coaching environment provides significant opportunities for informal learning as well as opportunities for application and on-going reflection, which are critical stages of the learning cycle and essential for continuing personal and professional development (Lave & Wenger, 1991; Kolb, 1984).

In an early study, Bloom et al (1998) examined the mentoring experiences of expert team coaches from Canadian sports including field hockey, ice hockey, basketball and volleyball using semi-structured interviews. This research established coaches had received informal mentoring experiences throughout their athletic and coaching careers but only labeled them as such retrospectively after they had recognized what the interactions were and how they had influenced their professional and, critically, personal lives. This retrospective concept is important to acknowledge; because it is only through experience and with increased awareness about personal and professional learning and development strategies that the recognition of how valuable a specific instance has been or the impact it has had on coaching performance and effectiveness.

It could be assumed mentoring occurs constantly in the practical coaching environment, although perhaps subliminally within various mentoring relationships including coach-mentor; coach-athlete and coach-coach (Baek-Kyoo, Sushko & McLean, 2012). Given the transitory and informal nature of mentoring opportunities it is difficult to gauge how effectively they contribute to long-term learning (For a coaching perspective see Nash & McQuade 2014 p. 206).
The distinction between formal and informal mentoring lies in the formation of the mentoring relationship (Jones, 2013). Informal relationships, which are the most prevalent in the sports coaching industry are spontaneous, grow organically and are not managed, structured or formally recognized (Chao, Walz & Gardner, 1992). By contrast, formal relationships are sanctioned and managed and structured by an organization, (Srivastava & Thakur, 2013). In formal coach mentoring situations, such as the Canadian Women in Coaching Program administered by Canadian Association of Coaching (CAC), mentors are integrated into the learning support with defined roles and assigned to a mentee or group of mentees (Nash, 2003; Marshall, 2001). The CAC believe structured programs require a strategically planned approach, should have a coordinator, facilitated matching of mentor and mentee, training and support where appropriate, and a formalized career development and tracking system (Marshall, 2001). More recently, the UK Coaching Certificate (UKCC) promotes the use of a mentor to support self-directed and work-based learning across all UKCC levels and some sports, including athletics, cricket and golf, have formalized this role at UKCC levels 3 and 4.

In the UKCC formalized mentoring is evidenced through the recruitment and deployment of mentors, typically from the coach developer pool that exists within the sport, although some sports are now recognizing the benefits of using non sport-specific mentors (sports coach UK, 2012). Bloom (2013) suggests that in Canada the use of non-sports specific mentors in smaller sports is a challenge as there is a lack of suitably qualified personnel. However in the UK, these mentors, whether sports specific or not, are allocated to support coaches and may work with three or four coaches at any one point in time. Typically the relationship occurs remotely through electronic mediums and in the field with mentors tasked to support learning and development and in some instances undertake assessment.
functions. However, the structures, exact roles, outcomes and effectiveness of these UK-based formalized mentoring programs and mentor-coach relationships is extremely unclear and yet to be evaluated.

Focusing on the mentoring relationship, regardless of whether it has been formally or informally constructed is important as, mentors play a significant role supporting and guiding the learner to identify, analyze and ultimately reflect on a context or coaching issue and identify relevant solutions (Gilbert & Trudel, 2006). The guidance function assumed by mentors is widely referenced (Jones, Harris & Miles, 2009; Cushion, 2006; Cassidy, Jones & Potrac, 2009). Guidance can be integrated through “scaffolding” (Vygotsky, 1978), a sociocultural theory, which proposes that a more knowledgeable coach provides scaffolds or supports to facilitate the learner’s, or performer’s development. Scaffolds may include instructions, resources, a compelling task, templates and guidance (Vygotsky, 1978). As the learner or performer develops their cognitive, affective and psychomotor skills and knowledge, the scaffolds are gradually removed (Collins, 1991). Vialle, Lysaught & Verenkina (2005) explored this concept in relation to child-athlete development although parallels can be drawn with mentoring adults. Vialle and colleagues suggest that the coach adjusts the amount of guidance to fit the performance level so more support is offered when the task is new or the learner is experiencing difficulty and less support is offered when competence and expertise increases, fostering learner’s autonomy and independence. Successful scaffolding assumes the mentor has sufficiently evolved skills to determine the most appropriate learner-centred pedagogy to guide the coach.

An effective mentoring relationship, again regardless of the formal or informal base, relies heavily on an evolved two-way communication process so avoiding the temptation to
tell or direct the learner to solutions is a key challenge to develop problem-solving skills (Tomlinson, 1995). Allowing the learner to develop their own responses rather than mimicking the mentor is fundamental to ensure the development of skills such as independent thinking and decision-making (Fletcher, 2000; Wickman & Sjodin, 1997). Simply being part of the relationship is not sufficient to invoke personal change. Gilbert and Trudel (2006) describe the mentor’s role as a sounding board and effective mentors need to be able to extract and synthesise information from the mentoring conversation. They need to use incisive questioning and model active listening to stimulate critical reflection and decision-making (Gilbert & Trudel, 2006).

The current mentoring research base in sports coaching is limited and at this time insufficient to effectively evaluate mentoring as a tool to support coach development (Cassidy, Jones & Potrac, 2009). As such many organizations, practitioners and educators within the field draw on learning provided by other domains that precede the coaching industry in their mentoring thinking and practice. These domains include business, education and nursing. Electronic mentoring will be explored as a discrete area because of its unprecedented growth as a medium for mentoring.

Mentoring in Business

Most business mentoring relationships adopt an outcome-led approach or have a results driven focus, however, there are arguments for and against this approach. For example, Megginson and Clutterbuck (2009) offer two contrasting perspectives; from one angle, they question the merits of a goal-oriented focus as the key driver and from another they suggest developing clarity around the goals can ensure a sense of meaning and direction, where support of the mentees is considered as key to the success of an outcome-led approach.
Traditional corporate mentoring relationships emphasise the use of the mentor’s power, influence and authority on the mentee’s behalf. That focus has now shifted to a more developmental approach supporting the mentee to develop autonomy and independence, empowered to access multiple sources of support and learning (Clutterbuck, 2004).

Reinforcing this developmental approach and drawing a parallel with sports coaching, Cassidy, Jones and Potrac (2009) suggest mentoring involves doing something “with” as opposed “to” the coach. “With” infers that any perceived hierarchical relationship has been levelled and there is an emphasis on the facilitation of learning and development as opposed to a one-directional approach stemming from mentor to mentee.

Within the corporate setting Kram (1988) suggested mentors could support learning and development through two broad functions. Career function is the umbrella term for sub-functions including “sponsorship, coaching, protection, exposure-and-visibility, and challenging work assignments” (p. 613). In the context of sports coaching, a more experienced coach acting as a mentor inevitably has an evolved network to which the mentee coach could be introduced. This could be significant in terms of signposting to new contacts, new opportunities and critically, new learning. The second function, the psychosocial function, includes “role modeling, acceptance-and-confirmation, counseling and friendship” (p. 614). Drawing the parallels with coaching again, the key psycho-social or support roles that complement coach learning could be identified as relationship building, confidence building, cheerleading, empowering, championing and being a critical friend.

Kram’s work (1988) has been the basis for further research within the corporate context. Studies of mentoring programs and informal mentoring relationships within corporate America, specifically journalism, engineering, social work (Ragins, Cotton and
Mentoring as a Coach Development Tool

Miller, 2000) and technology (Fagenson-Eland, Marks and Amendola, 1997) established that mentees engaged in informal relationships perceived greater psychosocial mentoring as compared to those arranged formally. Interestingly, Ragins, Cotton and Miller (2000) concluded mentee satisfaction in the relationship was more important than whether the relationship was formal or informal. How the quality of the relationship, regardless of its status (formal or informal), impacts upon mentoring effectiveness remains unanswered.

An intriguing research study, concerning the support for learner development is offered from a study of mentor-client relationships of young entrepreneurs with Youth Business International (YBI) (Cull, 2006). This study highlighted that mentors are required to use a less directive and more empowering approach to reduce dependency and increase self-confidence. The key skills of asking the right question, actively listening and paying attention to the language patterns, paralanguage and kinesics or body language are integral to the success of this approach (Cull, 2006).

The mentor is only one player in the mentoring relationship; the mentee is the other. The concept of two-way communication has already been explored through the research offered by sports coaching and in order for the two-way communication and the relationship to be successful; the mentee also has responsibilities to ensure a successful outcome. Klasen and Clutterbuck (2002) argue an effective mentee needs to assume responsibility, be pro-active by preparing fully, follow-up all meetings and conversations and be confident to talk openly. Inevitably this is only possible if there is transparent understanding of mentor and mentee roles and the boundaries of the relationship have been set.

Many business organizations have established formal mentoring programs. Formal mentoring
programs should not be substitutes for informal relationships, however, by constructing
formal programs Ragins and Cotton (1999) recommend making informed decisions about
who will be mentored, securing mentees commitment to voluntary participation; establishing
a matching process; minimizing rules governing how the relationship is managed and
maximizing the mentor’s personal freedom within the relationship. Collectively these factors
mirror the principles of high quality informal mentoring and could contribute to the outcome
and quality of the mentoring program and independent relationships in business and in sport.

**Mentoring in Education**

The largest body of research in mentoring has been conducted within education (Jones,
Harris & Miles, 2009; Bloom et al, 1998). Within the education field in England and Wales
mentoring is used as an induction or apprenticeship, to develop competency, provide
challenge and to support progression, (Department for Education and Skills (DfES), 2005;
Green, 2002). In order to assure coherence and a positive impact on teaching and learning the
DfES engaged in a capacity building exercise to define the functional roles of those involved
in supporting initial training and qualification and on-going or continuous professional
development CPD. They commissioned research, which included an extensive literature
review, 24 stakeholder-interviews, evidence gathering from mentoring practice in schools
and 17 consultation sessions across England with approximately 700 people. Each
consultation was used to develop, test and refine the resources emerging from the project.
The DfES (2005) recognise the integral role the mentor plays in supporting and developing
teaching practice and define mentoring as “a structured, sustained process for supporting
professional learners through significant career transitions” (p. 3). As a result of this
extensive research the DfES suggested effective mentoring involves a thoughtful relationship,
setting challenging and personal goals, having a learning agreement and learning
conversations, growing self-direction, understanding why different approaches work,
experimenting and observing and using resources and support effectively. These principles
are generic, can be applied across contexts and could be used to benchmark mentoring
practice in other domains including sports coaching.

These principles lend themselves to a developmental approach, which is consistent
with what Young et al (2005) refer to as the “responsive mentor”. Based on work conducted
with mentors and trainee teachers in North America, Young and colleagues identified three
patterns of mentoring; responsive, interactive and directive. According to Young et al (2005),
the responsive mentor looks to the mentee for guidance and direction with the mentee setting
the agenda, whereas interactive mentoring is a peer relationship where there is relational
parity within the mentoring pair and finally directive mentors assume control and work to an
agenda. Mentors do not typically confine themselves to one style but drift on a needs-led
basis within the relationship, which is consistent with Kram’s (1983) observation around
fluidity in business noting mentoring relationships are dynamic and changing.

How mentors and mentees are matched has been subject to research in education.
D’Abate and Eddy (2008) explored the use and effectiveness of mentoring in undergraduate
business education and suggested the effective matching of mentors with mentees is
fundamental to a successful relationship. In a formal mentoring program matching is
common practice and coordinators often assign mentoring pairs (Noe, 1988). A number of
studies have explored the practice of matching to identify cross-cultural awareness (Johnson-
explored matching in a cross-cultural academic context in order to analyze the complexities
of race, class and gender. They encouraged a black woman associate professor and a white
male full professor to reflect on the dynamics of their 13-year cross-cultural mentoring relationship. Their findings recommended mentees should be paired with mentors who share similar cultural backgrounds, identities, perspective and experiences of the world. They suggest informed matching could address potential problems within cross-cultural mentoring relationships because of a lack of cultural awareness, language and communication issues, and cultural-racial-ethnic heritages. Drawing on relevant research from another educationally driven cross-cultural perspective Frels and Onwuegbuzie (2012) suggest mentors need to model selflessness, active listening, honesty, a non-judgmental attitude, persistence, patience, and an appreciation for diversity. This research suggests these skills are critical in to order build the relationship but do not necessarily guarantee that the relationship will be effective. Perhaps the most critical building block for a successful cross-cultural mentoring relationship is trust (Crutcher, 2007; Johnson-Bailey & Cervero; 2004). From an extensive literature review conducted across business, education and health care, Jones, Harris and Miles (2009) suggest that trust must be sufficiently evolved so as to enable both partners to share successes and shortcomings and critically learn from the experience associated with both.

In her study of mentoring support for undergraduate sport coaching students within a Higher Education setting Nash (2003) established the highest-ranking qualities coaching students believed mentors should possess (effective communication skills, approachability and enthusiasm) and those mentors believed mentors should possess (knowledge of their sport, experience, organization and leadership). A comparison of the lists generated highlights the top ranking qualities perceived to be important by the coach and mentor does not match. It is assumed an early emphasis on developing mutual clarity through the exploration of the purpose of the relationship and both roles is essential. More recently the support for student coaches and university coaches is still seen as an area for concern (Nash,
Mentoring lies at the heart of nurse education with mentors performing a critical role facilitating learning and assessment within education and the clinical context (Hughes, 2004). The NME have defined the functional role of the mentor in the occupational standards framework (2008). The framework includes establishing effective working relationships, creating an environment for learning, facilitating and evaluating learning and leadership. The key role difference in nurse mentoring when compared with business and education is the overt assessment function, although the assessment function is assumed within coach education by some mentors in certain sports. Nurse mentors assess nurses and have “sign-off” responsibilities, making judgments about whether a student has achieved the required standards of proficiency for entry onto the NMC register (NMC Standards, 2008). Whilst the roles are notionally separate, inevitably mentors do act as assessors within practice settings which can present problems ensuring objectivity in the decision-making process (Andrews & Chilton, 2000). There is an additional mentoring role assumed within nursing and it is that of the long-arm mentor and in this context the long-arm mentor fulfills a supervisory role.
conducted remotely supporting the nurse mentor as opposed to nurse trainee.

The integration of mentoring into the nurse education system has experienced problems. From an extensive literature review Andrews and Wallis (1999) established the concept and role was unclear, with different models and frameworks proposed for the various mentoring activities. They cite the fundamental reason for this as a lack of a clearly defined role, suggesting the term mentor carries a multiplicity of meanings including preceptor, coordinator, facilitator and supervisor. Despite the lack of clarity and transparent definitions research exploring student nurses perspective of the experience rated their mentor’s positively and aspects of the experience as supportive and effective, although this was contingent with having a secure productive relationship (Teatheredge, 2010; Andrews & Chilton, 2000).

Electronic Mentoring

The concept of long-arm mentoring exists within nursing and the role is a supervisory one, not necessarily conducted electronically. Regardless of the role and focusing purely on the “long-arm” terminology as a descriptor, it serves as useful metaphor for any mentoring relationship that is conducted predominantly on a remote basis and relies on the use of electronic technologies to sustain the relationship (Bierema and Merriam, 2002). An extensive literature review produced no research upon the effectiveness of this role although parallels can be drawn with the role performed by the electronic or e-mentor.

With the advent of modern technology the traditional concept of mentoring as a face-to-face support mechanism has been challenged (Panopoulos & Sarri, 2013). In the global corporate world mentoring has been integrated to provide both in-situ support and remote
support for international employees (Gibson, 2004). To be classified as e-mentoring, at least 75 percent of the relationship must occur electronically (Hamilton & Scandura, 2003). The most appropriate definition of e-mentoring to use as a reference point is offered by Bierema and Merriam (2002):

A computer mediated, mutually beneficial relationship between a mentor and a protégé that provides learning, advising, encouraging, promoting, and modeling, that is often boundaryless, egalitarian, and qualitatively different than traditional face-to-face mentoring. (p.214).

E-mentoring unlike the traditional format does not have to happen in situ, it can be asynchronous, occur anytime and anyplace and problems associated with geography and travel time are easily negated. Bierema and Hill, (2005) suggest physical proximity between the mentor and mentee is no longer a requirement of the relationship and potentially mentors are more available to their mentees through e-mentoring. Online technologies enable mentoring relationships to be cultivated regardless of race, gender, physical ability, or other personal variables and this increased equalitarianism increases access for all involved in the mentoring process (Johnson-Bailey & Cervero, 2002).

Traditional electronic media widely used include text, e-mail, Internet and intranet and there are various emerging technologies that could be used. E-mentoring currently has a dominant text-based nature which can provide a written record of the process and the inevitable time lag between communications could be used to foster a more deliberative, reflective, and thoughtful exchange assuming people take advantage of the time delay to consider and respond in an informed manner (Bierema & Hill, 2002). The opportunity to
engage through Skype and other visually based technologies are ideal opportunities to
replicate the role of the missing mentor in the field and engage in face to face conversation,
although the effectiveness of this as a medium to support the mentoring relationship has yet
to be explored comprehensively.

There are challenges associated with e-mentoring. Physical access to the internet is a
key requirement and it cannot be assumed that all people have 24x7 access especially in
developing countries. Intellectual access can also be a challenge with using online
technologies; technical competence and confidence or information literacy skills to use
electronic media are essential (Hill, Wiley, Han, & Nelson, 2003). Assuming both mentor
and mentee can access the internet there is still the issue of the one-dimensional nature of
text-based technologies. Messages can be open to misinterpretation and even distorted
because the recipient cannot gauge the sender’s intent (Hamilton & Scandura, 2003).

Anecdotal evidence suggests many current mentoring relationships within sports
operate on a remote basis and inevitably rely on internet and computer-based technologies to
support the communication process (Lamb & Aldous, 2014). However, at this time there is
limited evidence of e-mentoring happening within sports coaching or indeed what mediums
are used to support the relationship and how effective these are. Research in e-mentoring
within coach development should be identified as a priority in order to establish the
effectiveness of this approach. Key learning for the future development of this type of
mentoring should then be shared across coaches, across sports and across countries because
its potential use is universal.

Recommendations for Future Practice and Research
The aim of this paper was to examine relevant mentoring literature generated across sports coaching, coach development and wider domains (business, education, nursing) to highlight how mentoring has been positioned to support a wide variety of functional roles. Electronic mentoring was explored as a discrete area because research conducted in this domain offered insight into how the remote or long-arm element of the mentoring relationship might be constructed and conducted (Williams, Sunderman & Kim, 2012). Although mentoring is gaining acceptance within coach education, there is still consistent support for the 15-year old claim that mentoring in coaching lacks a clear conceptual definition (Cassidy, Jones & Potrac, 2009; Jones, Harris & Miles, 2009; Bloom et al., 1998). Mentoring remains an ill-defined activity, especially in sport coaching, possibly due to the diverse use of the term and variety of contexts in which mentoring occurs (Jones, Harris and Miles, 2009).

Coaching is a very complex activity and, added to that occurs in a variety of contexts. The ICCE (2012) suggest that sports participation can happen in two broad areas; participation or performance sport, with each including a number of sub-categories (See p.15 for further details). Added to this coaches can be part-time or full-time, paid or voluntary and have an eclectic mix of learning experiences. In North America there is also the practice of student-coaches who undertake practicums or internships as part of their university course. Given these numerous combinations of contexts and experiences the establishment and subsequent evaluation of mentoring programs remains a challenging but ultimately rewarding endeavor.

To allow key aspects drawn from the research presented in this article a series of reflective questions that the organization or practitioner should seek to answer before committing to constructing any form of mentoring program, using mentoring as a coach development tool or engaging in any mentoring practice. The questions in Figure 1 are
Mentoring as a Coach Development Tool

suggested to be considered as key before the organization or implementation of any coach mentoring program, regardless of the level or context.

Insert Figure 1 about here

The answers to these questions may provide the organization with some guiding principles against which they can construct their own program and position mentoring as a coach development tool. Critical to the success of any program constructed will be on-going and post-program evaluation to establish the:

1. effectiveness of the program in setting up and managing the various relationships
2. roles, functions and working practices assumed by mentors
3. characteristics and qualities of the effective mentor and coach
4. effectiveness of the mentor-coach relationship

The use of e-mentoring in sport coaching cannot be underestimated as a potential tool to help the development of effective sport coaches. Given that many sports coaches feel isolated and disconnected in their practice, tend not to value formal education and are lacking a professional structure the use of electronic media could help in addressing some of these perceived issues. Promoting e-mentoring as a coach development tool could enable many smaller organisations to access more coaches, recruit more geographically dispersed mentors and provide a valuable service with reduced costs. This type of e-mentoring could be of use across many coaching contexts, such as, volunteer coaches, coaches in education and elite coaches as well as a wide range of organisations.

Mentoring as a Coach Development Tool

Mentoring as a Coach Development Tool

Key Questions to be considered

What is the role of the mentor within the organization’s coach education structure?

How many coaches require mentoring?

Will the program offered be a formal or informal program?

Who would assume the role of mentors?

Will the organization need to provide training for the mentor to ensure they have the relevant skill sets and expertise to undertake the role?

How will mentors and mentees be selected?

Figure 1: Key Questions
