Ten Simple Rules for Finishing Your PhD

Jacopo Marino, Melanie I. Stefan, Sarah Blackford

1 Department of Chemistry, University of Zurich, Zurich, Switzerland, 2 Department of Neurobiology, Harvard Medical School, Boston, Massachusetts, United States of America, 3 Society for Experimental Biology (SEB), Lancaster University, Lancaster, United Kingdom

Introduction

After years of research and with completion in sight, the final year of the PhD often represents the most challenging time of a student’s career, in which the ultimate reward is the PhD honor itself. A large investment in time, energy, and motivation is needed, with many tasks to be completed; concluding experiments must be carried out, results interpreted, and a research story mapped out in preparation for writing the final thesis. All the while, administrative obligations need attention (e.g., university credits and mandatory documents), papers may need to be published, students mentored, and due consideration paid to planning for the next career move. Without some form of strategic action plan and the employment of project management skills, students run the risk of becoming overwhelmed and run down or of not meeting their final deadlines. Personal time management and stress resilience are competencies that can be developed and honed during this final period of the PhD.

Here, we present ten simple rules on how to deal with time issues and conflict situations when facing the last year of a PhD in science. The rules focus on defining research goals in advance and designing a plan of action. Moreover, we discuss the importance of managing relationships with supervisors and colleagues, as well as early career planning.

Rule 1: Plan Your Last Year in Advance

Preparing a plan of action for the final year of your PhD is vital. Ideally, devised and agreed upon with your supervisor, a plan will help to optimize the time left and reduce feelings of being overwhelmed. Individuals plan in different ways; some prefer to work towards their goals in a stepwise linear fashion, whilst others are more comfortable flitting from task to task until all the jobs are done. There is no definitive way to plan, so find out what works best for you. You may decide to map out a timeline, or perhaps a mind-map is your preferred planning style. Whichever method you use, it’s important that you adhere to your plan whilst allowing for some flexibility (but not distraction or procrastination).

Your time frame will vary according to the organization of your graduate school, your supervisor or advisory committee, and even your graduation date, but one year before submission of your doctoral thesis is the time when you should decide on how best to invest the last months of your research and associated activities. Having a plan of action will help to avoid time wasting, e.g., being distracted by superfluous experiments that might be interesting but are not necessary. Furthermore, from a psychological point of view, referring to a concrete plan can make you feel more secure and in control. Ideally, the supervisor and PhD student should both agree on the overall plan (with provision for the unexpected, e.g., technical issues), with intermittent reviews every few weeks to check that progress is being made. Your supervisor should also be able to advise you on the organization and writing of your thesis—for example, its structure—and the number and length of chapters to include.

Rule 2: Make Your Priorities Clear

Select the activities you want to include in your plan. What are your priorities? They are likely to include experiments that will give the thesis a conclusion or that may be necessary to publish a final paper. Mandatory administrative tasks will also need attention, and allowing time to prepare for your next career move will give you the best chance of a seamless and successful transition post-PhD. As a final year PhD candidate, you are likely to have acquired high-level competencies comparable to those of a junior postdoctoral researcher, in which case your supervisor may offer you responsibility for new projects or graduate students. Saying no to him/her can be difficult for various reasons, e.g., fear of potentially creating conflict in your relationship or causing a negative reaction or of perhaps losing the opportunity to be included in future research activities and publications. It can also be difficult to let go of a topic or project to which you are wedded or to miss out on the opportunity to help train the next generation of scientists. In such situations, referring back to your plan (Rule 1), previously agreed upon with your supervisor, should help to remind you both of your priorities and deadlines, making negotiation easier. However, should any conflict of opinion arise between you, bear in mind that finding a mutually agreeable solution is the best way forward. You can take advice from a mentor or refer to the many publications that provide approaches and tactics for effective negotiation. If the relationship between you and your supervisor is more complicated and cannot be resolved by a discussion, you may need to turn to your graduate school, your academic committee, or other senior managers in your institution, who can act to mediate the situation.

Rule 3: “The Truth Can Wait”

A research project is never really finished, so do not try to do everything...
before submitting. In fact, the perfect doctoral thesis does not exist; there are students with good research projects and many publications and others with more difficult and testing challenges who are still waiting for their first paper. If the project is ambitious, it might take several years to reach the final goal, and thus the thesis might only be a small part of the whole story. If the project is going well, it will open up new research questions and future directions, some of which will be beyond the scope of a PhD. At some point, you need to decide that what you have is enough for a PhD and start writing (a strategy we heard described at a dissertation-writing seminar in Cambridge as “the truth can wait”); it helps to write this on a post-it note and stick it on your computer). Starting to write the thesis is not easy when there is a sense that more could be done to accumulate more data and a fuller story; a common mistake is to go back to the lab instead of getting started with the results chapters of the thesis. To postpone writing will cause delays and not necessarily improve the thesis whilst increasing the prospect of unfulfilled and extended deadlines. Thus, once the experiments have been completed, it is really important to start writing with the data in hand.

**Rule 4: Enlist Support**

Finalizing experiments and writing the thesis (and even papers), as well as considering your next career transition, can be stressful and even isolating. It is a contrast to the relatively more relaxed earlier years of the PhD experience, and the writing process does not come naturally to everyone. The prospect of facing these stresses alone can make the experience even harder to bear, so it is advisable to communicate with and find support in those you trust and respect. Relying on such people during this period can help to ease the strain and enable you to achieve your final aims so that you arrive at your PhD graduation with your sanity still intact! Talking about personal feelings with selected colleagues usually helps you to realize that you are not alone, whatever difficulties and challenges you might be experiencing with your research project, supervisor, or coworkers. Sharing uncertainties and talking through issues can be constructive, helping you to understand the strategies other people use to cope with similar problems. As well as colleagues, it can also help to talk to friends and family, even though they won’t be as au fait with the highly particular challenges you are experiencing. You can share your feelings and anxieties with them, but they can also act as a welcome distraction to help you to relax and take a break from thinking about the stresses of your PhD.

Support and advice can also come in the shape of courses, books, blogs, mentoring, etc. There is much published on the subject of how to write a thesis [1]. Furthermore, graduate schools, such as those in which we are based, usually offer courses to help PhD candidates improve their personal and professional skills. For example, the University of Zurich organizes courses on, amongst others, time and self-management skills, managing conflict, and academic writing and publishing [2]. The Graduate School of Arts and Sciences at Harvard lists workshops and resources offered across the university on topics such as scientific writing, time management, and overcoming procrastination. In addition to relying on your supervisor, post-doctoral researchers in your group or department (or even friendly collaborators) may agree to read chapters of your thesis and comment on aspects such as content, logical flow of ideas, and the overall structure. At a later stage, you may want to engage someone to check your grammar, spelling, and reference style (this can be especially important if you are not writing in your native language). If your PhD defense includes a presentation, try to practice beforehand, preferably in front of some of your peers, and include asking for feedback and possible questions that may come up. This should make you feel more prepared and confident.

**Rule 5: Get Familiar with the Software**

Being familiar with software for both writing and making figures will facilitate the creation of your thesis. One of the most effective tools with which to produce a scientific document is LaTeX ([www.latex-project.org](http://www.latex-project.org)). This software, freely available, is not as immediately understandable as other text editors, but the advantages are greater: it offers a professional layout similar to published books, it makes the insertion and management of figures easier as their position in the file does not depend on text editing, and it allows for easy typesetting of mathematical equations and referencing of articles from a bibliography database. Moreover, the text file size does not increase while inserting figures, making its handling easier. An example LaTeX package for typesetting dissertations is “classithesis”, written by André Miede ([http://www.miede.de/index.php?page=classithesis](http://www.miede.de/index.php?page=classithesis)). Although advantageous, LaTeX can also present disadvantages. In contrast to commonly used text editors (e.g., Microsoft Word), it does not make it easy to track changes in the manuscript, often a preferred way for supervisors to correct theses in an electronic form. Therefore, we suggest you discuss the preferred software with your supervisor when you agree upon your plan (Rule 1).

A professional design software can also speed up the creation of figures for your thesis, which can be further used for your final PhD presentation, so check whether your institution provides an introductory course to some of these software packages. Taking a one-day class can save you a lot of time later. Organize your bibliography; many excellent reference managers exist that allow you to catalogue and annotate the papers you have read and integrate them seamlessly with text processing software (e.g., Endnote or the freely available Mendeley and Readcube). Choose one that fits your needs and check whether your university provides institutional licenses (and be disciplined about adding each paper you read to it!).

Consider using version control software. This allows you to keep a log of all the changes you make to a file or directory and makes it easy to recover a previous version if something goes wrong or to merge two versions of a file. This is often used in software projects to produce, document, and improve computer code, but it can also be useful when working on a long text document, such as a dissertation. Commonly used free version control systems include git/GitHub [git, github], Subversion [svn], and Bazaar [bzr] (see Table 1).

Most important of all is to have a backup strategy. A hard-drive crash at the wrong moment can set your work back by weeks and jeopardize the timely completion of your thesis. Institutions or departments often have a backup system employees can make use of. This may require you to install a specific piece of software on your computer that backs up your data at regular intervals or to save your file on an institute server. Contact the information technology (IT) department at your institute to learn about your options.

**Rule 6: Know Your University’s Procedures and Regulations**

During the course of your PhD, you will have been acquiring project management skills, such as organizing your time and resources, reviewing progress, and meeting deadlines. In order to avoid last-minute
which can help to reduce stress and enable
have the situation more under control,
ments in order, you are bound to feel you
dedicated template file. With your docu-
formatting right early on, e.g., by using a
collecting them in a folder. Get the
go through the list of documents and start
and supporting documents. Take time to
numbers and format, font size, binding,
etc.), as well as the faculty criteria,
including deadlines (as well the date of
the graduation ceremony), thesis copy
handing in a thesis, it is advantageous to
introduce yourself to the institute secretary
or human resources manager, as well as
any other staff who can help you to deal
with the administrative side of the process.
Don't rely on previous documents, which
may have been revised since the last
person in your group graduated. Be aware
of all the necessary institutional adminis-
trative requirements (e.g., credit points,
research seminar attendance, publications,
etc.), as well as the faculty criteria,
early-career postdoctorals favorably. How-
and many industrial employers look upon
destination. This is perfectly acceptable,
a postdoctoral position as their first career
PhD graduates choose to continue on with
thesis introduction and future directions as
a basis for your research plan. If you are
teen to gain teaching experience, you
could propose a short course on your
specialty area. For instance, at Harvard
Medical School, senior graduate students
and postdoctoral researchers can be in-
volved in lecturing on short, specialized
“nanocourses” [3]. You may also be able
to deliver a specialized lecture within a
class your supervisor is teaching or, ideally
after you have completed the PhD, teach
at a workshop or summer school.

Take advantage of opportunities to
deliver a talk as an invited speaker at a
conference or at another institute, for
example, if you are visiting a research
group or investigating possible postdoctor-
al options. This will give you the chance to
practice your defense presentation in front
of an unfamiliar audience and, at the same
time, allow a potential future supervisor
and colleagues to gain a more complete
picture of your research interests, skills,
and personality.

Rule 8: Pay Attention to Your
Career

It is not always easy to decide on which
career path to follow after your PhD. You
have been trained primarily towards an
academic research career, and so many
PhD graduates choose to continue on with
a postdoctoral position as their first career
destination. This is perfectly acceptable,
and many industrial employers look upon
early-career postdoctorals favorably. How-
ever, it is worth bearing in mind that
permanent tenured positions are hard to
secure nowadays and competition is
tough, with less than 5% of those who
complete a PhD ultimately realizing an
academic career [4]. For those who are
determined to have an academic career, a
strategic research plan is crucial; for those
who are unsure, a viable alternative career
plan is equally important.

Knowledge of your professional and
personal skills and capabilities, personality,
values, and interests, as well as how to map
them onto the job market and sell them to
employers, will help you to make effective
career decisions and a successful transition
to your next job. In addition, factors such
as your personal situation and priorities,
mobility, and preferred work-life balance
all need to be taken into consideration
before entering the complicated world of
the job market. Be ready to make compromises
either in your work or
personal life, depending on your priorities.
Take advantage of courses and profession-
al career guidance and coaching while you
are still at university, as they are usually
offered free of charge. Along with books
and websites, face-to-face career support
can help raise your self-awareness and
knowledge of the job market so you can
start to decide which types of career may
best suit you. Blackford’s book and blog
[4] contain useful material on career
planning for bioscientists, with concrete
examples of different career paths within
and outside of academia, and further
information and resources. In addition,
the ScienceCareers portal offers an online
tool [5] to create an individual develop-
ment plan and explore your career options
based on your skills, interests, and values.
Also, take advantage of dedicated career
job boards associated with specialist web-
sites, such as that of the International
Society for Computational Biology [6].

How soon should you start job seeking?
Finding a job whilst writing up your thesis
can seem like an attractive prospect, but
it’s important to consider that applying for
does can easily take up as much time as
working a full-time job. Then, if you do
secure a job, the time left for writing up
your thesis, completing experiments, and
wrapping up your lab work will be
seriously limited. It is exceedingly hard to
write a doctoral thesis in the evenings after
work or on the weekends, so in case you
are offered a job before you have finished
the PhD, consider seriously how this might
affect your work and life. On the other
hand, finishing a PhD when scholarship
money has been seriously reduced (or has
run out) comes with a different set of

<table>

<th>Available</th>
</tr>
</thead>
</table>

Table 1. List of free version control systems.
challenges. Many students need to tap into their savings (if indeed they have any), drastically reduce their spending, and move out of their accommodation. Losing employment at the university can also affect health insurance, social security, and visa status. Finishing up a PhD under these additional constraints and pressures can be extremely challenging, both logistically and psychologically. To ensure that you can concentrate all your time on (and get paid for) finishing your PhD, start planning ahead one year earlier. Be aware of your university’s regulations, talk to your supervisor about the funding situation (is it possible for you stay on as a postdoctoral researcher for a short period?), and know what you need to do in order to finish on time (Rule 1).

Rule 9: Network

Unofficial statistics tell us that only around 30% of jobs are advertised, so to enhance your employment prospects you would be well advised to network in order to access the hidden job market. During the final year of your PhD, and even earlier, you can build up and extend your network so that your chances of finding the job of your choice are optimized. If you are looking for research positions, your supervisor might have contacts or know about positions available in academia or industry. Reviewing your personal network further will reveal it consists of colleagues, friends, and family. You may also have a wider network of collaborators (research and industry), people associated with your research whom you have met during the course of your PhD, as well as many others. Conferences, seminars, informal gatherings, and learned societies are great places to meet the academic community face to face or to broaden your horizons. Job fairs are held at universities and sometimes during conferences, where experts from industry look for potential employees as well as sometimes provide informal advice on your curriculum vitae (CV). Try to exploit these opportunities if they come your way.

A relatively recent, and highly democratic, addition to the networking system is social media, through which it is possible to meet people online from all over the world and from all walks of life. More and more professors, researchers, students, policy makers, science “celebrities”, science communicators, industry personnel, and professionals have a presence on social media, using it primarily for work-related purposes. Researchgate, LinkedIn, and Twitter are probably the most useful platforms for networking with academia, business, and the wider world, respectively. Your online profile should be fully completed and reflect your expertise, achievements, and personality. Used to greatest effect, social media will give you access to information, jobs, and influential people—it’s importance to you as a PhD student cannot be overestimated.

Rule 10: Leave on Good Terms

Wrap up the work in your lab, especially if you are leaving the institute. This includes any required training of new personnel in the methods and techniques you use, having lab notes in order, making it easy for other lab members to access your protocols and data, organizing and labelling your reagents and equipment, and documenting your computer code. If someone is taking over an unfinished project from you, take time to hand it over. Discuss with your supervisor to find a solution for who will do the final experiments, how to proceed with the writing of journal manuscripts, and what should be the order of authorship. If you have started a project that you want to take with you to your new lab, discuss with your supervisor how to handle possible future publications and how to agree on material transfer. If your work resulted in patents or patentable innovations, make sure you are clear about regulations concerning patents and intellectual property, both at your PhD institution and at the institution to which you are moving. Stay in touch with your former colleagues and cultivate the contacts you have made in graduate school; they are sure to be useful during the course of your career.

Acknowledgments

Jacopo Marino is grateful to colleagues from the University of Zurich for the everyday discussions that have inspired this manuscript. Melanie I. Stefan is likewise grateful for discussions on the topic with fellow predocs (and sympathetic postdocs) at the European Bioinformatics Institute. She would also like to acknowledge advice and support from Nicolas Le Novère and Susan Jones, which helped her navigate her PhD and graduate in a timely manner. She has since learnt a lot from discussions with colleagues at the California Institute of Technology, the University of Tokyo, and Harvard Medical School.
