20 **To the Editor** - Early phase trials (phase I or phase I/II) are studies conducted in healthy
21 volunteers or patients aiming at determining drug disposition (absorption, distribution,
22 metabolism and excretion), adverse effects, drug exposure, pharmacodynamic (PD) biomarker
23 activity and clinical activity. A critical step in treatment development, results from early phase
24 trials directly influence decisions on further trials and whether the selected doses and schedules
25 are sufficiently safe and have promising results on treatment activity.

26 Often termed dose-finding or dose-escalation studies, early phase trials account for a large number
27 of the trials being run at any given time: A search of ClinicalTrials.gov for phase I studies first posted
28 between 2019 and 2020 returns 8536 entries, versus 5162 phase III trials first posted over the same
29 period. Attrition rate throughout the drug development process is high, and the success rate
30 between phase I studies and marketing authorisation has been reported as between 9.8% and
31 13.8% based on several studies (1, 2), with failure being primarily attributable to either poor
32 tolerability or lack of biological activity (79% of failed studies over the period 2016-2018) (3).

33 In this context, it is crucial that phase I trial results are assessed accurately, to avoid progressing
34 candidate treatment to subsequent phase studies with a false or imprecise sense of tolerability and
35 activity, or conversely discontinuing a tolerable and biologically active treatment. Incorrect
36 assessment of early phase trials could waste time, resources, and may expose participants to
37 ineffective or even harmful treatments (4). To allow accurate assessment of early phase trial results,
38 it is crucial they are reported precisely, transparently and in sufficient detail.

39 Contemporaneously, phase 1 trials have also seen a trend toward the use of biology-based,
40 hypothesis-testing and biomarker driven, more complex designs including arguably more efficient
41 novel designs, such as model-based or model-assisted designs. A model-based design uses a model
42 to describe the dose-toxicity relationship, whereas a model-assisted design does not; both generally
43 use a combination of probability models and rules to drive decision-making. 1.6% (20 of 1,235
44 oncology phase I published trials) used such novel design approaches in 1991-2006 (5), with this
45 increasing to 2.4% (5/212) in 2009 and 9.7% (22/226) in 2014 (6). This increased complexity of trial

46 design and conduct should come with increased transparency and reporting demands to ensure
47 methods and results are reproducible.

48 The CONSORT (CONsolidated Standards of Reporting Trials) 2010 statement is the recognised quality
49 standard for reporting randomised trials and the adoption of CONSORT by many scientific journals
50 has contributed to an increase in reporting quality and completeness (7,8). However, early phase
51 dose-finding trials may be non-randomised, and therefore may not have used the CONSORT 2010
52 statement to report their findings, though many of the checklist items may apply. Additionally, early
53 dose-finding trials have specific features that are currently not covered in the original CONSORT
54 2010 statement. Examples of specific features that require additional reporting considerations
55 include: starting dose and justification, recruitment and dosing process, definition of dose-limiting
56 toxicities (including length of assessment window), interim dose decision making and recommended
57 dose(s) selection criteria.

58 Therefore, there is a need for an extension to the existing CONSORT 2010 guidance aimed at dose-
59 finding trials. Dose-finding CONSORT extension will incorporate the unique features of dose-finding
60 trials, be applicable regardless of the specific trial design that has been implemented or disease
61 area, and will facilitate trial interpretability and support reproducibility of methods.

62 To address this challenge, an Executive Committee has been assembled comprising: a multi-
63 disciplinary team of international methodologists and clinical trialists experienced in early phase
64 trials in both academia and pharmaceutical industries; a CONSORT group representative; and a
65 patient and public representative. The Executive Committee will produce a robust and
66 comprehensive international consensus-driven guidance using gold standard methodology
67 following the methodological framework for guideline development recommended by the
68 CONSORT group (9). A rapid methodological review of published early phase dose-finding trials will
69 be conducted to identify deficiencies in their reporting, and inform the initial generation of the list
70 of candidate items for the Dose-finding CONSORT Extension. The initial draft checklist will be
71 further enriched through review of the published and grey literature (such as guidelines or reports
72 from regulatory bodies and professional working groups) and consultation with international
73 experts, including regulators and journal editors. A modified Delphi process will then be used to
74 refine the checklist before an international consensus meeting, which will agree on minimum
75 essential reporting items that should be included in the guideline.

76 Throughout the development process, strong international multi-stakeholder involvement will
77 include early phase methodologists and trialists including clinicians, research nurses, trial managers
78 and statisticians, journal editors and peer-reviewers, ethics committees, funders, regulators and
79 patient and public partners. Involvement will ensure the produced guidance reflects the views of the
80 wider early phase trials community. The Executive Committee will pilot test the near-final guidelines
81 with real-world trial examples to identify any gaps, troubleshoot any problems and incorporate
82 feedback in the final revision.

83 To maximise awareness and engagement as well as promote maximum uptake, a detailed
84 dissemination strategy will be implemented. This will include workshops tailored to specific target
85 groups such as journal editors, and the production of lay summary papers as well as publications of
86 the various aspects of the work in academic journals.

87 Once published, it is expected the Dose-finding CONSORT Extension will benefit the community
88 in several ways as shown in Table 1.

89 Table 1: Benefits of the Dose-finding CONSORT Extension

Benefit
Promoting transparency and adequate reporting in early phase dose-finding trials
Enhancing reproducibility of methods
Enhancing the understanding and interpretability of early phase dose-finding trials results
Providing a framework for peer review of early phase dose-finding trial reports by editors and peer-reviewers, as well as supporting the general readership in the critical appraisal of the quality of the trial design and methods, and the risk of bias in the reported outcomes
Helping researchers in designing early phase dose-finding trials
Used as an educational tool for researchers
As a result of the above benefits, the guidance will ultimately contribute to reducing research attrition and better patient care.

91 In the medium to long-term, this Dose-finding CONSORT Extension will benefit society by
 92 improving the efficiency and accuracy of dose-finding trials and accelerate the safe
 93 development of novel therapies.

94 The Executive Committee would like to invite interested stakeholders to register their interest in
 95 taking part in the Delphi Survey process via the Dose-finding CONSORT Extension project website
 96 (10).

97 **Acknowledgements:**

98 This work is funded through an MRC-NIHR Methodology Research Programme grant “Early Phase
 99 Dose-finding Trials: Development of reporting guidance to improve knowledge transfer” (Grant Ref:
 100 MR/T044934/1). CJW was supported in this work by NHS Lothian via Edinburgh Clinical Trials Unit. SL
 101 was funded through the National Center for Advancing Translational Sciences, National Institutes of
 102 Health (Grant Number UL1TR001873) TJ received funding from UK Medical Research Council (MC UU
 103 00002/14). This reporting guideline under development is registered on the EQUATOR (Enhancing
 104 Quality and Transparency of Health Research) Network database. All the named authors are part of
 105 the Dose-finding CONSORT Extension Executive Committee.

106 The authors acknowledge the support of Professor Elizabeth Garrett-Mayer, American Society of
 107 Clinical Oncology; Professor Deborah Ashby, Imperial College London; and Professor John Isaacs,
 108 Newcastle University and Newcastle upon Tyne Hospitals NHS Foundation Trust, members of the
 109 Independent Expert Panel in contributing their expertise and support to this initiative. The
 110 authors also thank the late Professor Doug Altman, Centre for Statistics in Medicine, University
 111 of Oxford, for his enthusiasm, inspiration and his significant contribution to the initial conception
 112 of this work.

113 **Authors Contributions:**

114 • CY, JdB, MD, JE, SH, TJ, AK, SL, AM, CJW were responsible for conception and funding: AE and
 115 CY drafted the manuscript; all authors critically revised the manuscript for important intellectual
 116 content and approved the final version.
